Question

Given the recent uptick in delays on the NYC Subway, does weather play any significant role?

Overall Approach

Ingest

1. Extract data once every 90 sec.
2. Parse and store raw in MongoDB
3. Send new records to Kafka topic

Processing

1. Deduplicate subway data and explode records (1 observation per line, per status update)
2. Round down Subway and weather timestamps and join into one dataframe
3. Extract encoded values (1 or 0) for certain features (e.g., signals, nypd)

Visualize

1. Send data to Kafka topic for pickup
2. Script sends from Kafka MongoDB
3. Index with Elasticsearch
4. Visualize with Kibana

DEMO

Conclusions

- Overall, it does not appear that weather is a major cause of NYC Subway delays
- Weather might exacerbate other primary sources of subway delays (signal problems, overcrowding)
- More data would be needed to get a better idea of weather's actual impact

Considerations

- More that might be done (e.g., compare with turnstile data)
- Airflow and Kibana are excellent tools
- Largest challenge was just making everything work together given constraints
